(a)

(b)

Masks (training images only): lesion fraction M^L and detected-artifact fraction M^A of each cell

▼

Training: $\mathcal{L}_{\text{les}}$ moves the attention α_j of every prototype onto the lesion (Section III-B)

▼

Constrained push: $p_j \leftarrow$ closest admissible cell ($M^L \geq 0.5$, $M^A \leq 0.05$; green) of class $c(j)$

▼

Last-layer refit; inference needs no masks
